Abstract:

Some simulation theorists, most notably among them Alvin Goldman, consider introspection as a necessary element for third-person mindreading. This view has been challenged on the ground that it is committed to an analogical inference from self to target of mindreading which threatens simulation theory to collapse into theory theory. In response, Robert Gordon proposed the radical version of simulation theory that denies any role for introspection, and hence, any need to analogical inference in simulative mindreading. In this talk, I will introduce the notion of “projective introspection” and discuss that how by utilizing this notion, the introspectionist simulation theory can dissolve the problem of analogical inference. Moreover, I will show that how the schizophrenic delusion of thought insertion can be accounted for by failure of projective introspection.
