Abstract:

Disagreement with other people is a very common phenomenon in our social life. This phenomenon can be epistemically disturbing because it is not clear what we should do when discovering such a disagreement. According to conciliatory approaches to disagreement, you should lower your confidence in your beliefs, when you find yourself in a “peer disagreement” situation. Although such an approach seems to be a plausible response to peer disagreement, it is actually confronted with two important problems, namely, the “self-defeating problem” and the “skepticism problem”. In this lecture, after describing these two difficulties, I’ll explain conciliationist’s strategies for responding the problems and then evaluate whether they will work.
